Practical-1

Practical 1: Project Initiation, Requirement Analysis, Sitemap, Wireframe, and GitHub Setup

Problem Definition Initiate the semester-long StudentHub portal by identifying the problem scope, user roles, key modules, navigation flow, and minimum 10 pages.
Create a sitemap, low-fidelity wireframe, project folder structure, README file, and GitHub repository.

Key Questions / Analysis / Interpretation

1. What is URL and parts of URL?
Answer: Write your answer in your own words. Do not copy and paste content directly from AI tools. At the end of your answer, provide the website(s) or reference link(s) you used for research

2. How does HTML file processed in web browser?
Answer: Write your answer in your own words. Do not copy and paste content directly from AI tools. At the end of your answer, provide the website(s) or reference link(s) you used for research.

3. How will page navigation flow managed among all HTML pages?
Answer: Write your answer in your own words. Do not copy and paste content directly from AI tools. At the end of your answer, provide the website(s) or reference link(s) you used for research

4. How will GitHub commits be maintained after each practical?
Answer: Write your answer in your own words. Do not copy and paste content directly from AI tools. At the end of your answer, provide the website(s) or reference link(s) you used for research

GitHub Repository Link

:https://github.com/vidhipatel2008/25DCE091-web/blob/main/sitemap.pdf

Challenges Faced: I found it difficult to plan the navigation flow between multiple pages and organize the project folder structure. Understanding GitHub commits and maintaining project changes after each practical also required practice.

Learning Outcomes: I learned how to plan the StudentHub portal by identifying its scope, user roles, key modules, sitemap, and navigation flow. I also understood how HTML pages work in a browser and how GitHub helps maintain project versions.

Faculty Remarks:

Practical-2

Practical 2: Semantic HTML5 Pages with Accessibility-Ready Structure

Problem Definition Develop static HTML5 skeletons for at least 10 StudentHub pages such as Home, About, Register, Login, Dashboard, Events, Profile, Contact, Admin, FAQ, and Feedback. Use semantic tags and accessibility-friendly structure.

Key Questions / Analysis / Interpretation

1. Are semantic tags such as header, nav, main, section, article, aside, and footer used properly?

Yes, semantic tags such as <header>, <nav>, <main>, <section>, <article>, <aside>, and <footer> are used properly to define different parts of a webpage. They improve code readability, accessibility, and SEO (Search Engine Optimization).

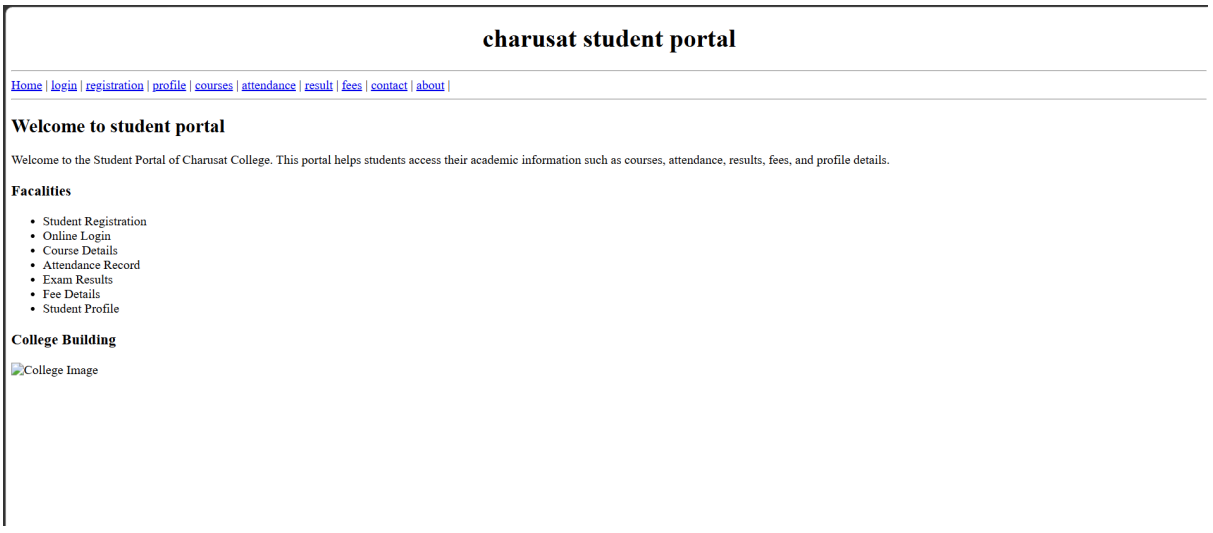

2. Are form labels, headings, image alt text, and navigation links accessible?

Yes, form labels are connected to input fields, headings follow a proper hierarchy, images have descriptive alt text, and navigation links are clear and easy to use. This improves accessibility for all users.

3. Is the page structure consistent across all pages?

Yes, the page structure is consistent across all pages. The header, navigation bar, main content, and footer follow a similar layout, making the website easy to navigate and user-friendly.

About Our College

CHARUSAT UNIVERSITY is one of the leading educational institutions dedicated to providing quality education and developing students into skilled professionals. The college offers modern classrooms, experienced faculty, well-equipped laboratories, and an excellent learning environment.

Vision

To provide quality education and prepare students for successful careers through knowledge, innovation, and ethical values.

Mission

- Provide quality education.
- Develop technical and professional skills.
- Encourage research and innovation.
- Build leadership and teamwork qualities.

Facilities

1. Library
2. Computer Laboratory
3. Wi-Fi Campus
4. Sports Ground
5. Cafeteria
6. Placement Cell

Challenges Faced: I found it difficult to choose the correct semantic tags for different sections and maintain a consistent structure across all pages. Making forms and navigation accessible also required practice.

Learning Outcomes: I learned how to create semantic HTML5 pages using tags like <header>, <nav>, <main>, <section>, and <footer>. I also understood how to make webpages accessible using proper labels, headings, image alt text, and consistent navigation.

Faculty Remarks:

Practical-3

Practical 3: Responsive UI Design using CSS Grid, Flexbox, and Bootstrap/Tailwind

Problem Definition Design responsive layouts for Home, About, Registration, Dashboard, and Events pages using CSS Grid and Flexbox. Optional to use CSS framework such as Bootstrap or Tailwind. Ensure mobile-first responsiveness.

Key Questions / Analysis / Interpretation

1. How does the layout adapt for mobile, tablet, and desktop screens?

The layout uses responsive CSS and media queries to adjust the content, font sizes, and navigation according to different screen sizes.

2. Which layout technique is used and why?

Flexbox and CSS Grid are used to arrange elements properly. They make the layout flexible, responsive, and easy to manage.

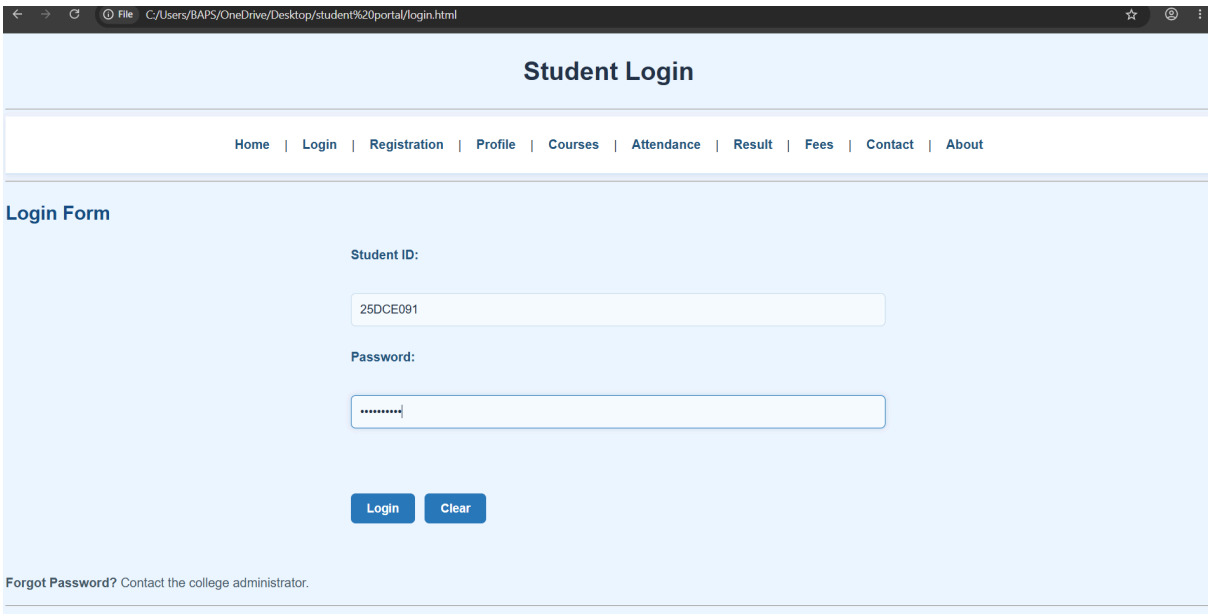

3. Are typography, spacing, colors, and contrast readable?

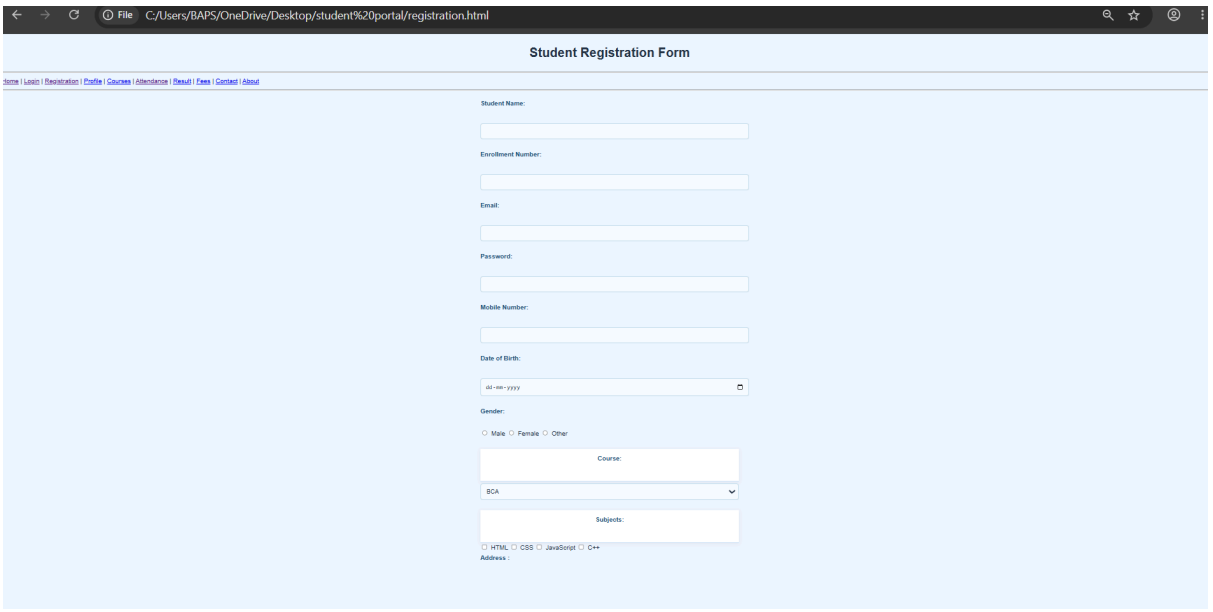

Yes, readable fonts, proper spacing, consistent colors, and sufficient contrast make the website clear and user-friendly.

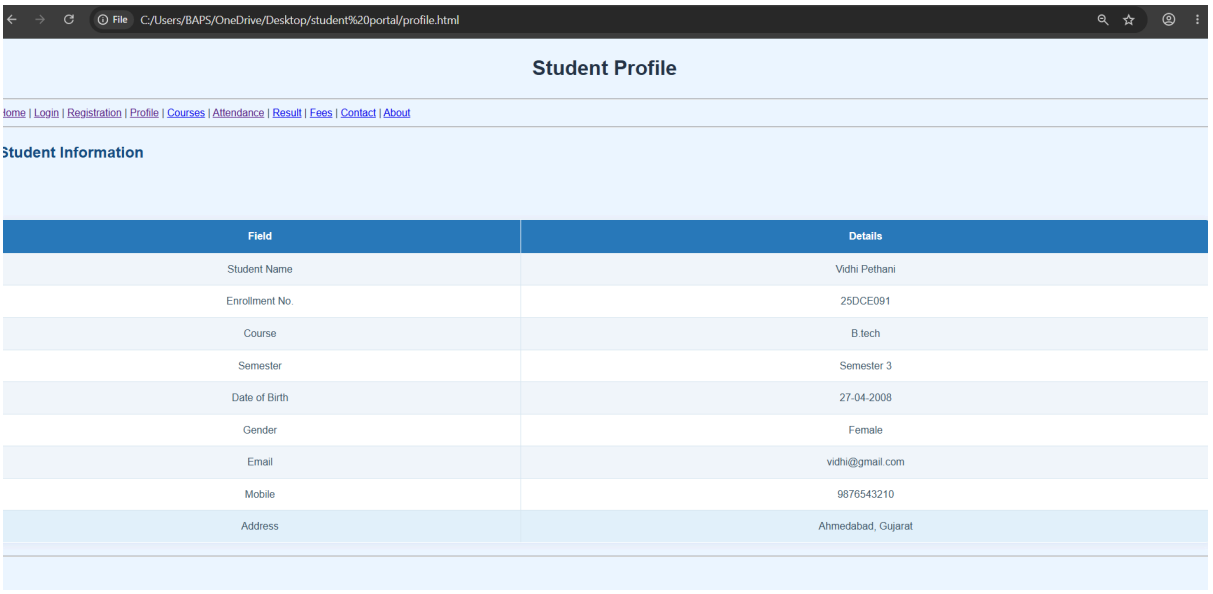

4. Is the framework used consistently without unnecessary inline CSS?

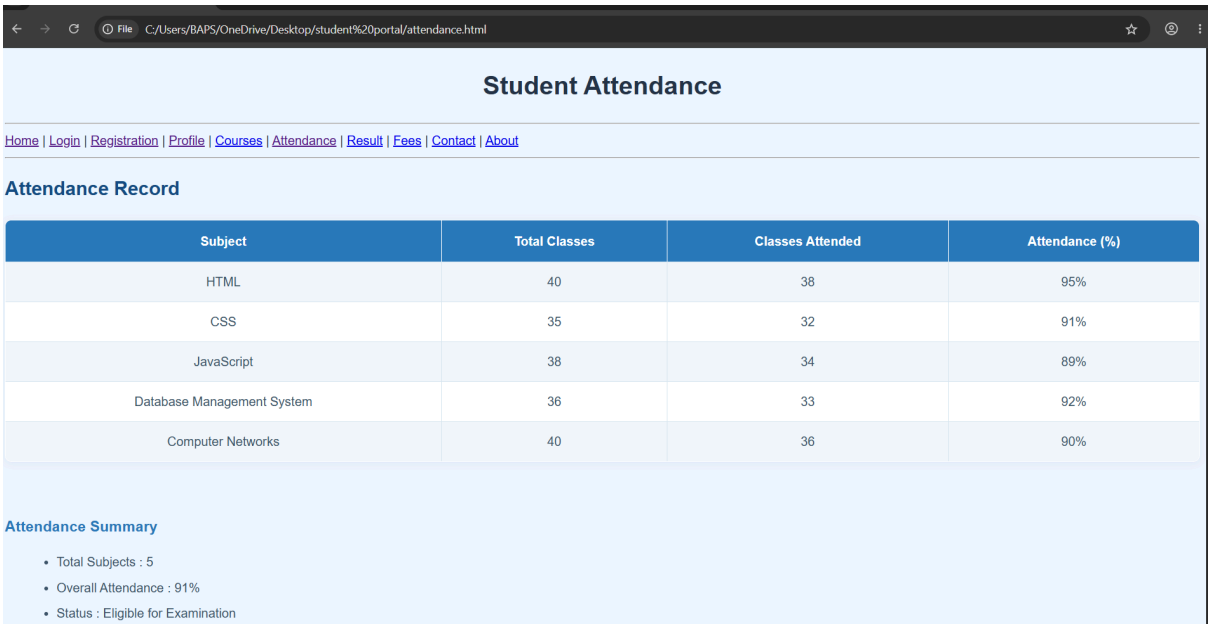

Yes, CSS styles are maintained in an external stylesheet and applied consistently across pages. This improves code reusability and makes maintenance easier.

Challenges Faced: I found it difficult to adjust layouts for different screen sizes and choose between CSS Grid and Flexbox. Maintaining consistent spacing, alignment, and readability across mobile, tablet, and desktop screens also required practice.

Learning Outcomes: I learned how to create responsive webpages using CSS Grid, Flexbox, and media queries. I also understood the importance of proper typography, spacing, colors, and external CSS for designing a user-friendly interface.

Faculty Remarks:

Practical-4

Practical 4: JavaScript DOM Manipulation, Event Handling, and UI Interactivity

Problem Definition Add dynamic UI components such as collapsible FAQ, modal popup, image/content slider, notification banner, hamburger menu, and light/dark theme switcher using JavaScript.

Key Questions / Analysis / Interpretation

1. How are DOM elements selected and modified?
DOM elements are selected using methods like getElementById() and querySelector(). Their content, styles, and attributes are modified using JavaScript.

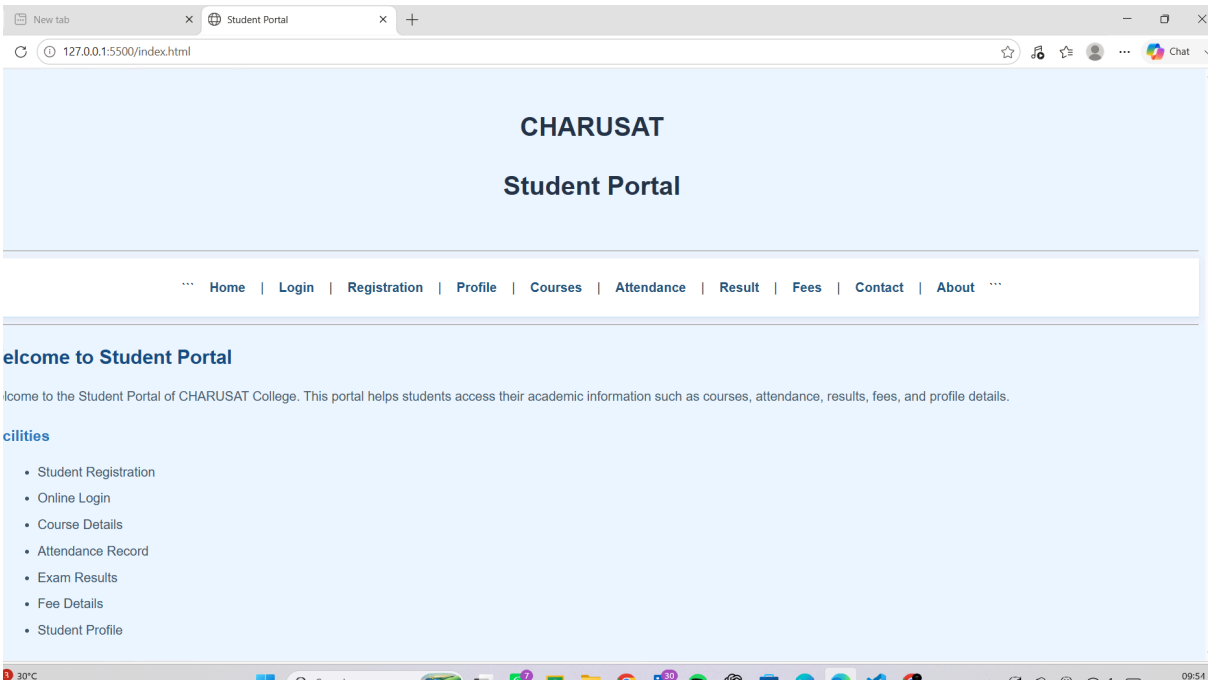

2. Are event listeners attached correctly?
Yes, event listeners are attached using addEventListener() to handle events such as clicks, form submissions, and button actions.

3. Is localStorage used for remembering theme choice?
Yes, localStorage can store the user's selected theme, such as light or dark mode, and remember it when the page is reopened.

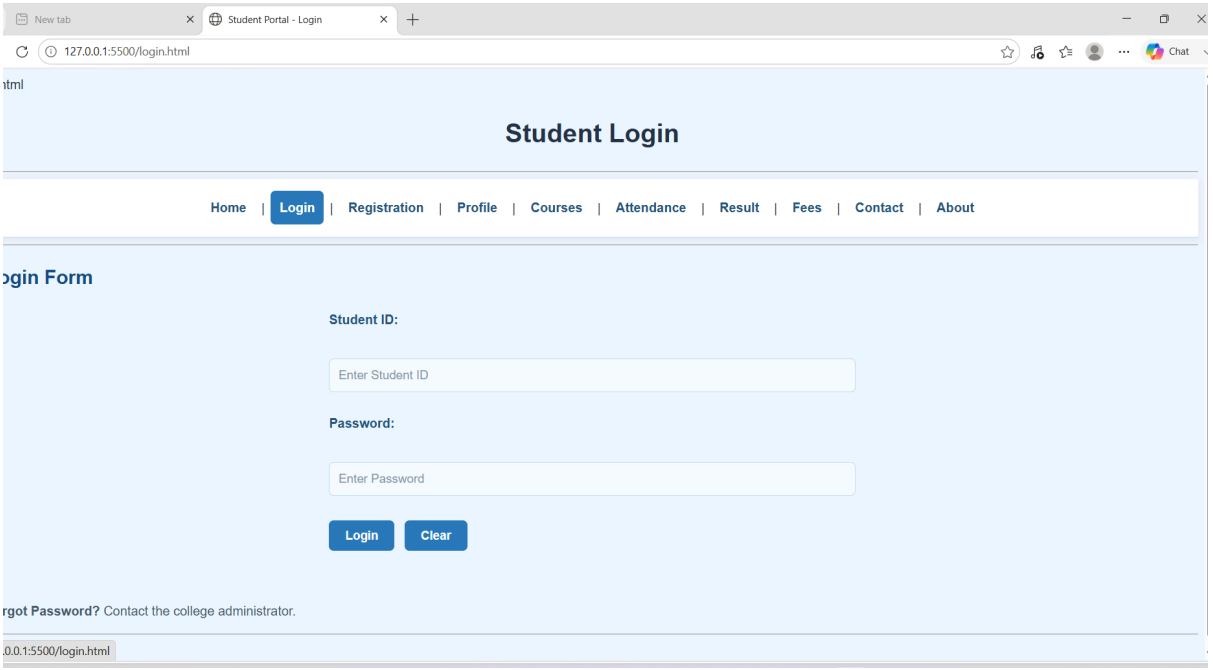

4. Does interactivity improve usability without breaking accessibility?
Yes, interactive features like menus, sliders, and FAQs improve usability. Proper labels, keyboard navigation, and clear focus indicators help maintain accessibility.

Frequently Asked Questions
What is CHARUSAT?
CHARUSAT is a university providing education in different technical and professional fields.
What facilities are available?
The university provides library, computer laboratory, Wi-Fi campus, sports ground, cafeteria and placement facilities.
How can students access the portal?
Students can use the navigation menu to access login, courses, attendance, result and fee details.

Challenges Faced: I found it difficult to manage DOM elements and handle events correctly. Implementing the dark mode preference and making interactive components accessible and user-friendly also required practice.

Learning Outcomes: I learned how to select and modify HTML elements using JavaScript DOM methods and handle events using `addEventListener()`. I also understood how to create interactive features like FAQs, sliders, popups, and dark mode using `localStorage`.

Faculty Remarks:

Practical-5

Practical 5: Registration Form with Frontend Validation and User-Friendly Error Handling

Problem Definition Create a student registration form with HTML5 input types and JavaScript validation for name, email, mobile number, password, confirm password, course, year, gender, and terms acceptance. Use Regular Expression for validations.

Key Questions / Analysis / Interpretation

1. Are correct input types and attributes used?

Yes, appropriate HTML5 input types such as text, email, tel, and password are used with attributes like required and placeholder.

2. Are validation errors displayed near the relevant fields?

Yes, validation errors are displayed near the respective input fields to help users identify and correct mistakes easily.

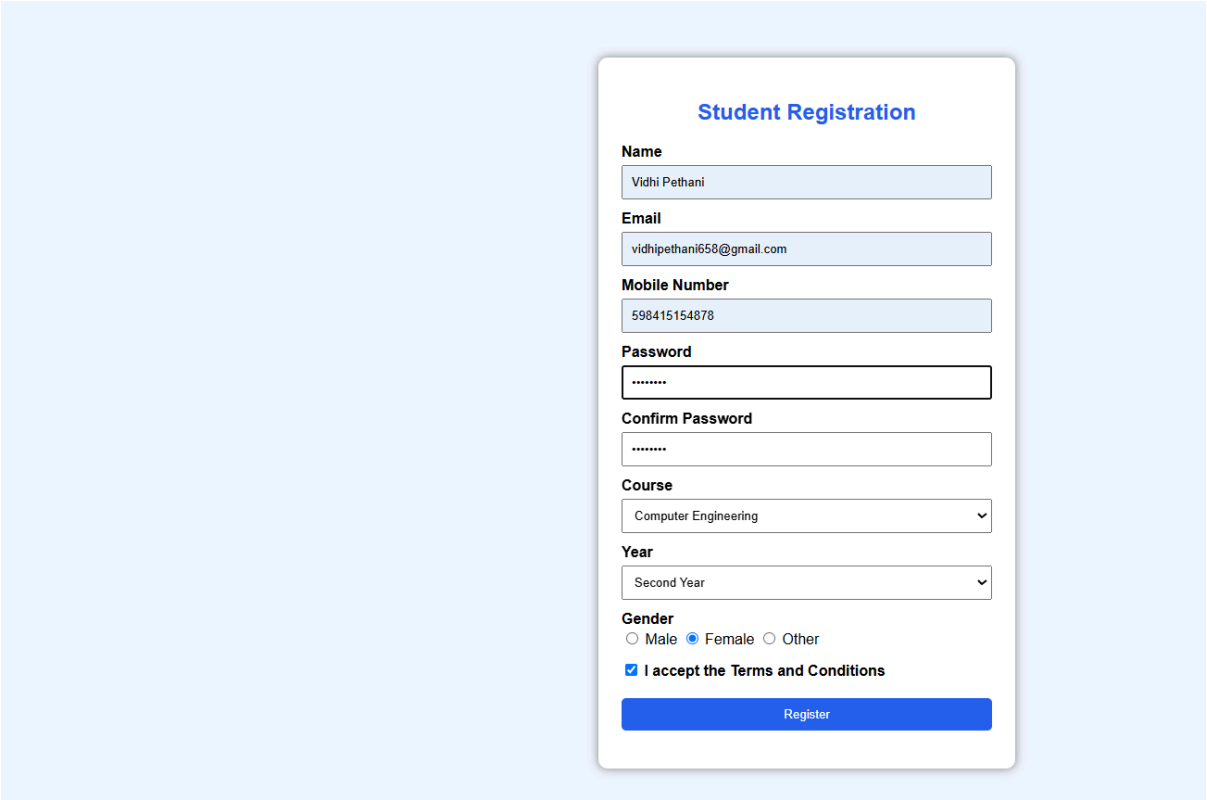

3. Is password strength checked?

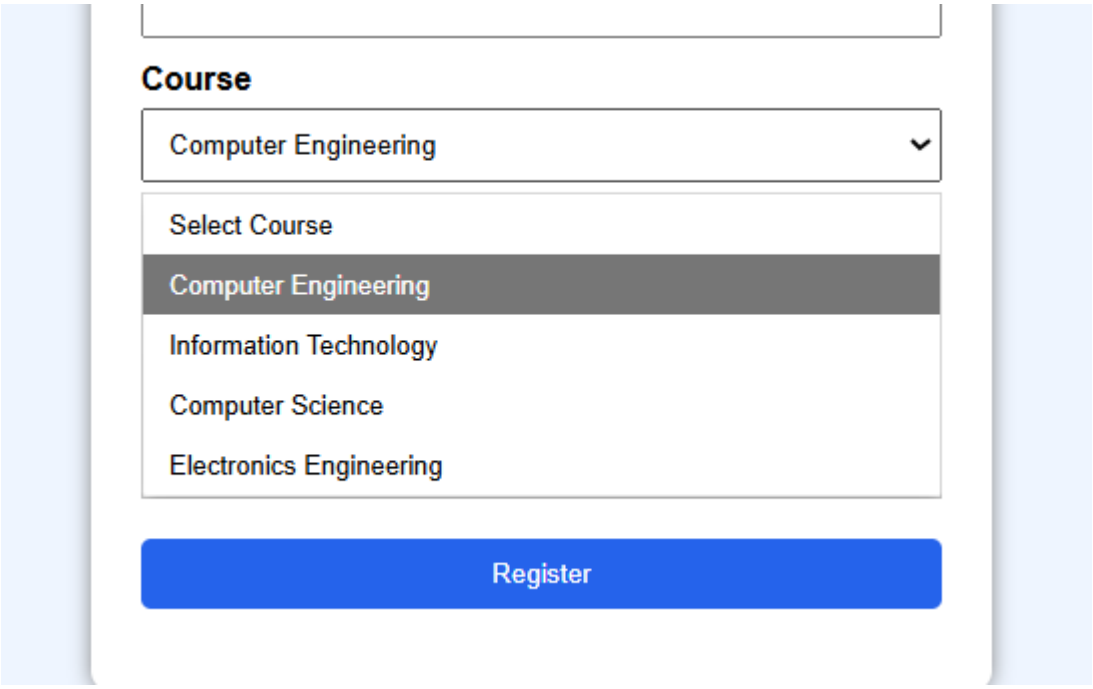

Yes, JavaScript can check password strength based on length and the use of uppercase letters, lowercase letters, numbers, and special characters.

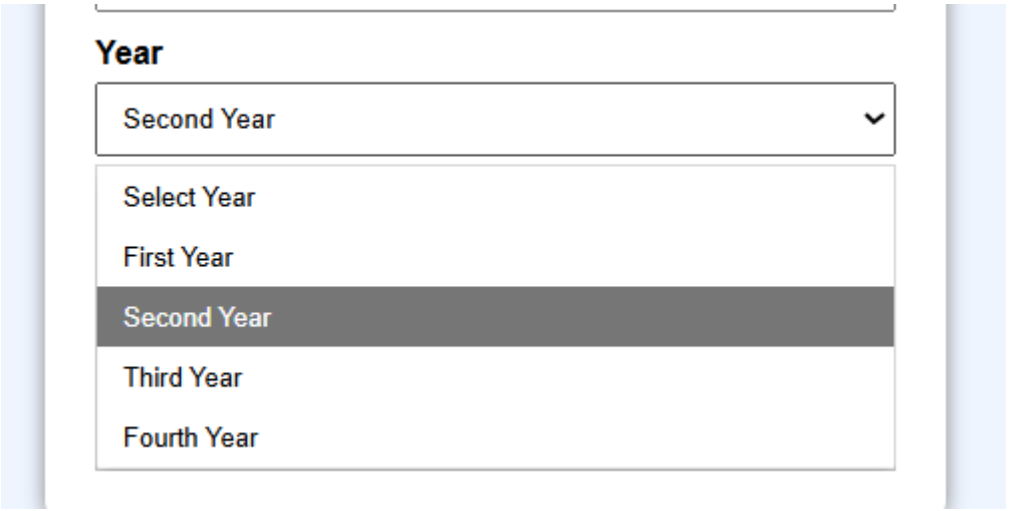

4. Is the form accessible using keyboard and screen-reader-friendly labels?

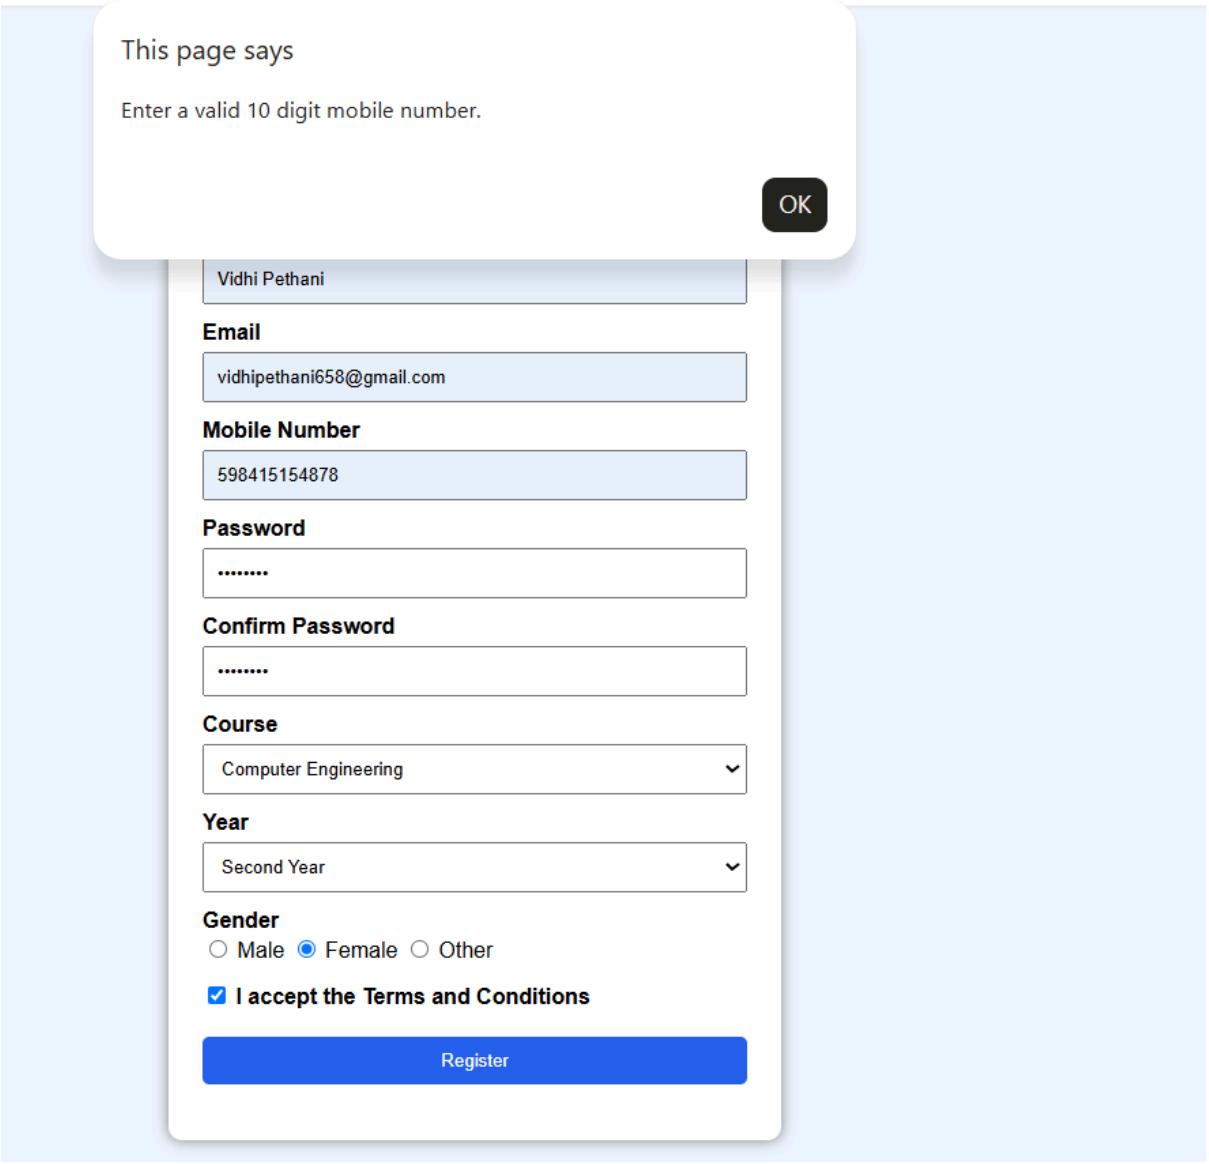

Yes, proper <label> elements, keyboard navigation, and clear error messages make the form accessible to keyboard users and screen readers.

Challenges Faced: I found it difficult to write Regular Expressions for different fields and validate password confirmation correctly. Displaying errors near the input fields and ensuring form accessibility also required practice.

Learning Outcomes: I learned how to create a student registration form using HTML5 input types and JavaScript validation. I also understood how to use Regular Expressions, check password strength, and display user-friendly error messages.

Faculty Remarks:

Practical-6

Practical 6: Rendering External JSON Data using Fetch API, Search and Filter

Problem Definition Display event lists, student profiles, notices, or FAQs from external JSON files using Fetch API. Implement dynamic rendering, search, filter, sorting, and pagination.

Key Questions / Analysis / Interpretation

1. How is JSON fetched, parsed, and rendered?

JSON data is fetched using the JavaScript fetch() method, converted into JavaScript objects using .json(), and displayed dynamically on the webpage using DOM manipulation.

2. Which array methods are used for search, filter, sort, and pagination?

- Search: includes() to find matching text.
- Filter: filter() to select matching records.
- Sort: sort() to arrange records.
- Pagination: slice() to display records page by page.

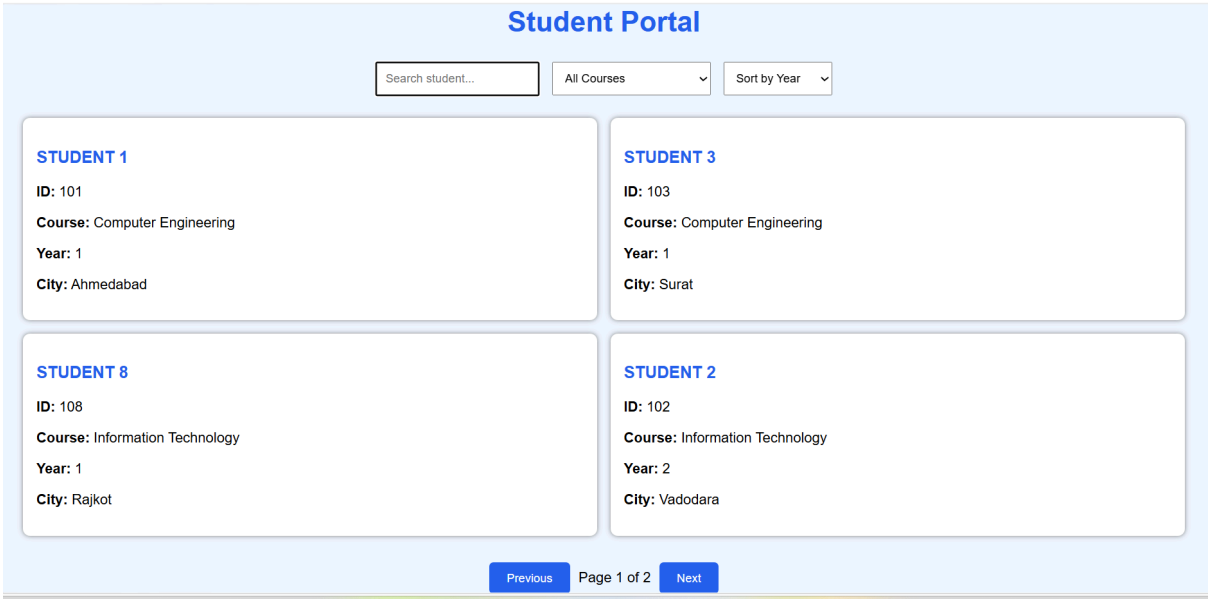

3. How are loading and error states handled?

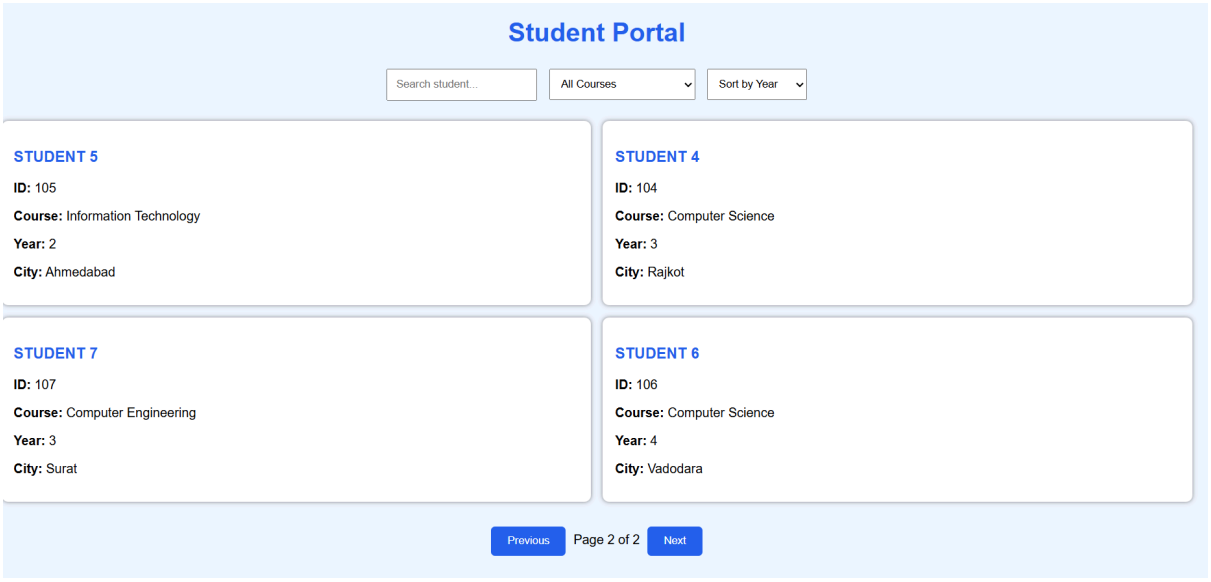

A loading message is displayed while data is being fetched. Errors are handled using .catch() or try...catch, and an appropriate error message is shown if the request fails.

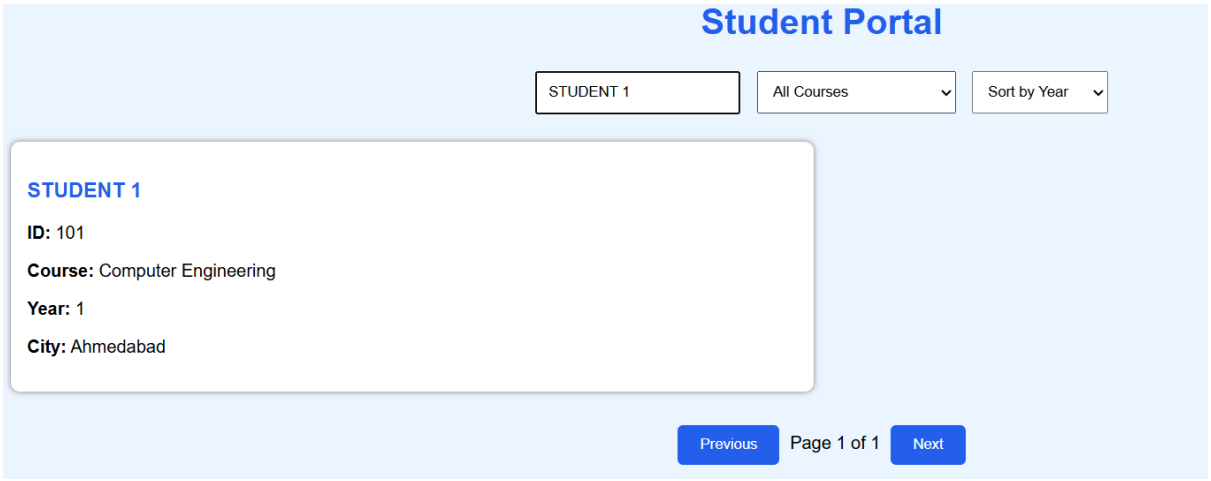

4. How is modularity maintained in JavaScript files?

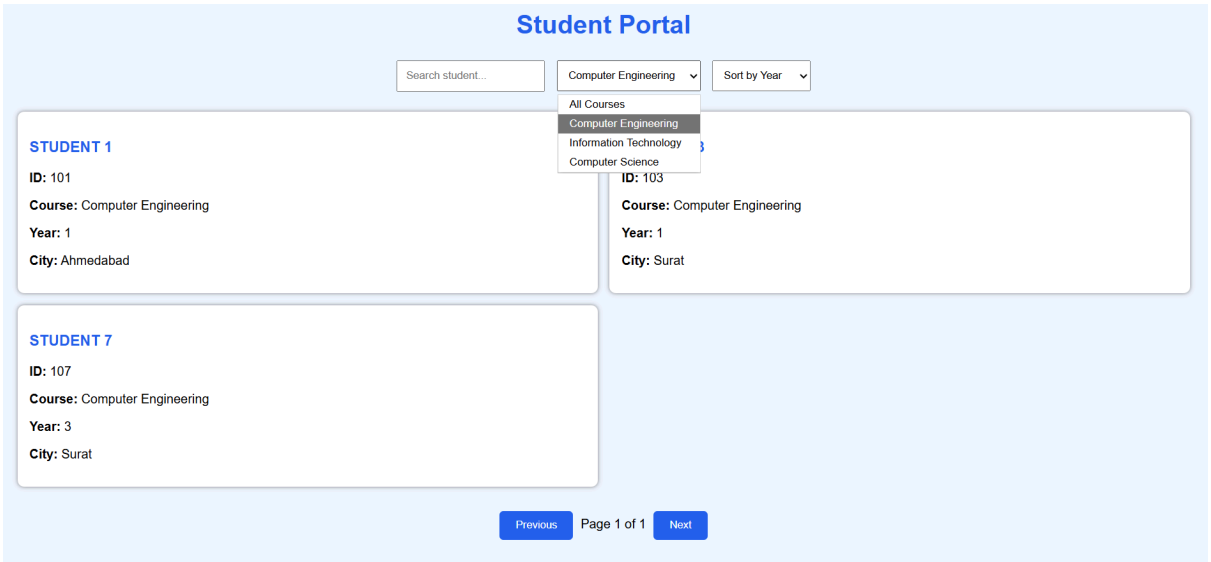

Modularity is maintained by separating JavaScript code into different files based on functionality and using export and import to reuse functions and keep the code organized.

Challenges Faced: I found it difficult to fetch and display JSON data correctly and implement search, filtering, and pagination. Handling loading errors and organizing JavaScript code into separate modules also required practice.

Learning Outcomes: I learned how to fetch external JSON data using the Fetch API and display it dynamically on a webpage. I also understood how to implement search, filtering, sorting, pagination, and error handling using JavaScript array methods.

Faculty Remarks:

Practical-7

Practical 7: PHP Form Processing with Server-Side Validation and CSV/JSON File Storage

Problem Definition Process submitted registration/contact form data using PHP. Validate and sanitize inputs on the server side and store records in CSV or JSON file format. Display success/error messages.

Key Questions / Analysis / Interpretation

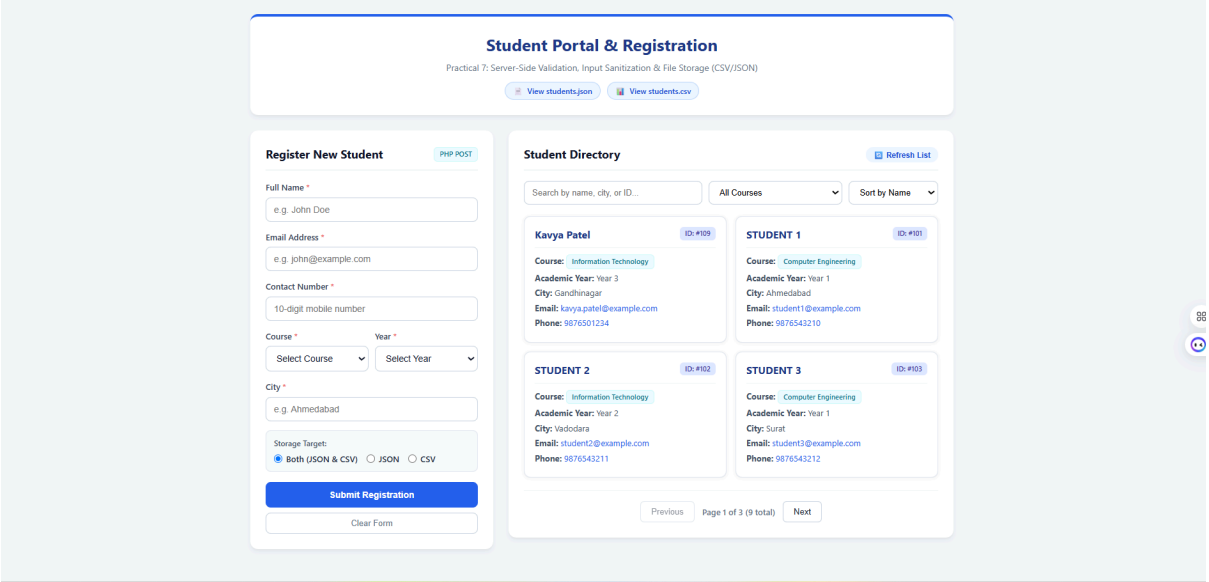

1. Is the form submitted using POST?
Yes, the form uses the POST method to send data securely to the PHP server without displaying it in the URL.

2. Are inputs validated and sanitized server side?
Yes, PHP validates and sanitizes user inputs to prevent invalid data and reduce security risks.

3. Is file writing handled safely?
Yes, submitted data is stored safely in a CSV or JSON file using PHP file-handling functions and appropriate file permissions.

4. Are success and error responses displayed clearly?
Yes, clear success messages are displayed when data is submitted successfully, while error messages help users correct invalid inputs or understand submission failures.

Output:

GitHub Repository Link :

https://github.com/vidhipatel2008/25DCE091-web/tree/main/practical%207

Challenges Faced: I found it difficult to validate and sanitize user inputs correctly and handle file operations in PHP. Storing submitted data safely and displaying appropriate error messages also required practice.

Learning Outcomes: I learned how to process form data using PHP and the POST method. I also understood server-side validation, input sanitization, CSV/JSON file storage, and displaying success and error messages.

Faculty Remarks:

Practical-8

Practical 8: MySQL Schema Design, ER Model, PDO Connectivity, and Prepared Statements

Problem Definition Design the database for StudentHub with students, events and registrations. Create PHP database connection using MYSQL statements.

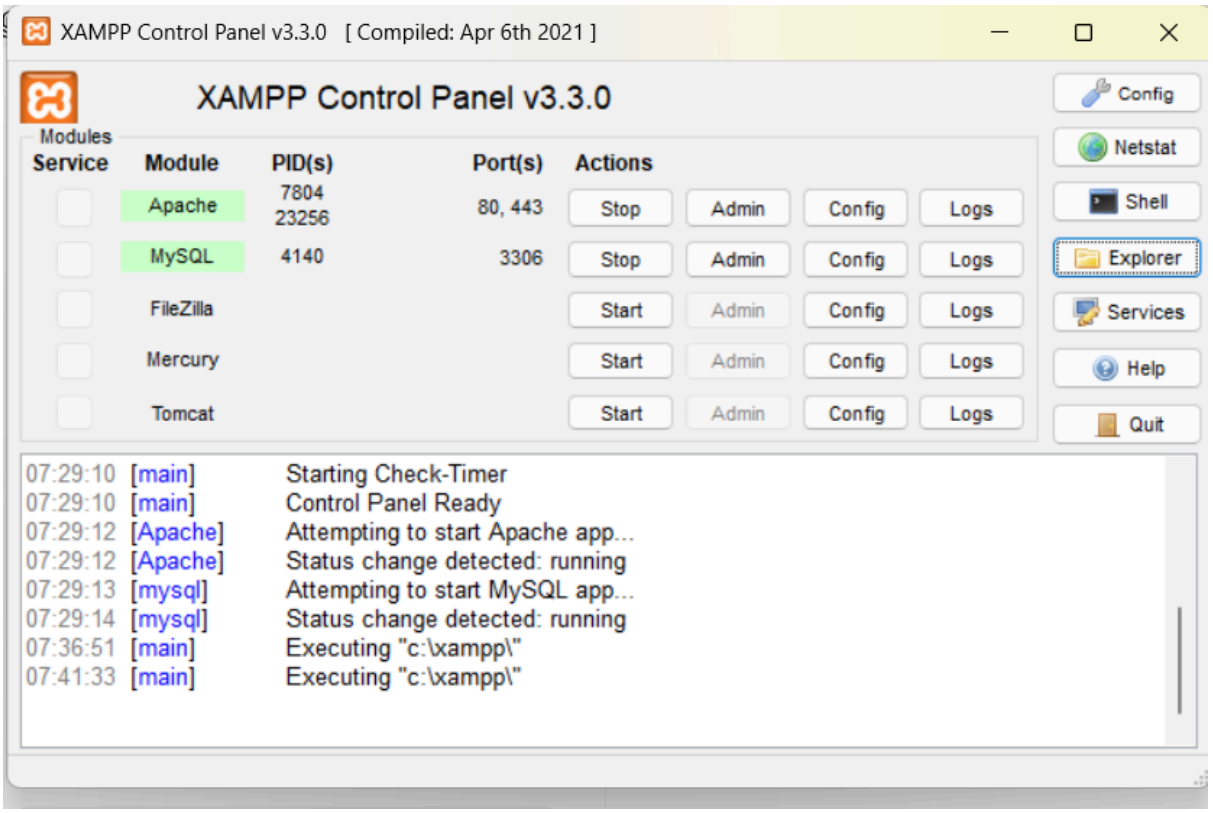

Key Questions / Analysis / Interpretation

1. Is the schema normalized properly?
Yes, the database schema is normalized to reduce data duplication and maintain data consistency.

2. Are primary keys and foreign keys correctly defined?
Yes, primary keys uniquely identify each record, while foreign keys establish relationships between tables and maintain referential integrity.

3. Is the database connection handled securely?
Yes, the database connection is handled using PHP, with credentials stored securely and prepared statements used to prevent SQL injection.

Output:

STUDENTS **REGISTRATIONS** **EVENTS**

---------- ---------- ----------

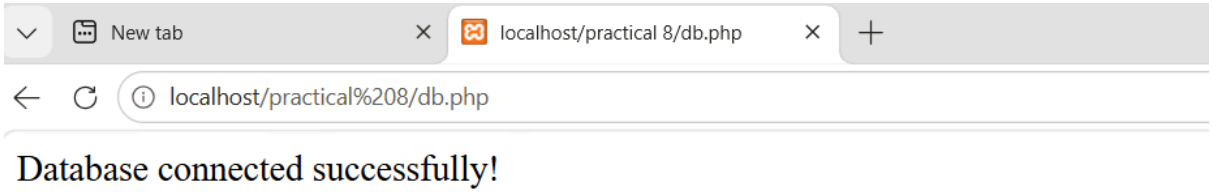

student_id (PK) 1 ---- M student_id (FK)

name registration_id (PK) event_id (PK)

email event_id (FK) M ---- 1 event_name

registration_date event_date

GitHub Repository Link
:https://github.com/vidhipatel2008/25DCE091-web/tree/main/practical%208

Challenges Faced: I found it difficult to design the database schema and establish relationships between tables correctly. Connecting PHP to MySQL securely and understanding prepared statements also required practice.

Learning Outcomes: I learned how to design a normalized MySQL database and create relationships between students, events, and registrations using primary and foreign keys. I also understood PHP database connectivity and the use of prepared statements to prevent SQL injection.

Faculty Remarks:

Practical-9

Practical 9: Secure User Registration with Database Insert, Duplicate Email Check, and Password Hashing

Problem Definition Implement secure user registration by inserting user details into MySQL using MYSQLi. Validate input on frontend and backend, check duplicate email/username, hash passwords using password_hash(), and display appropriate messages.

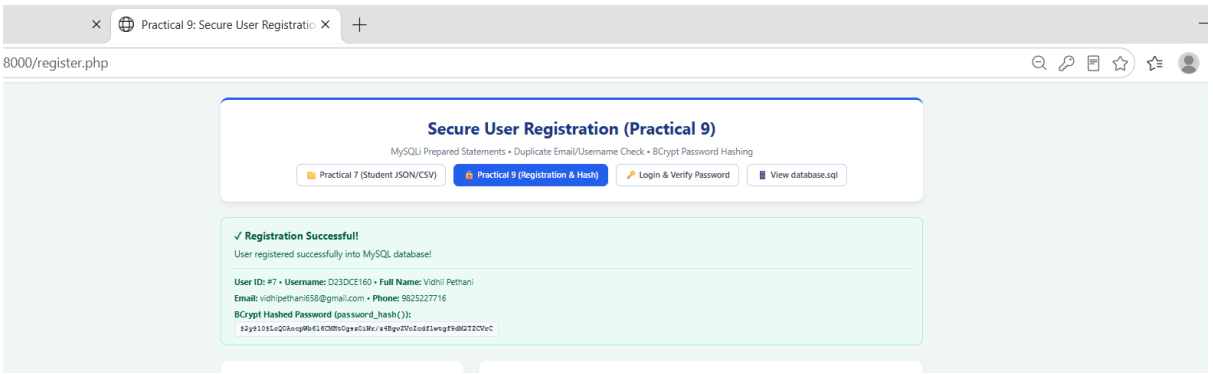

Key Questions / Analysis / Interpretation

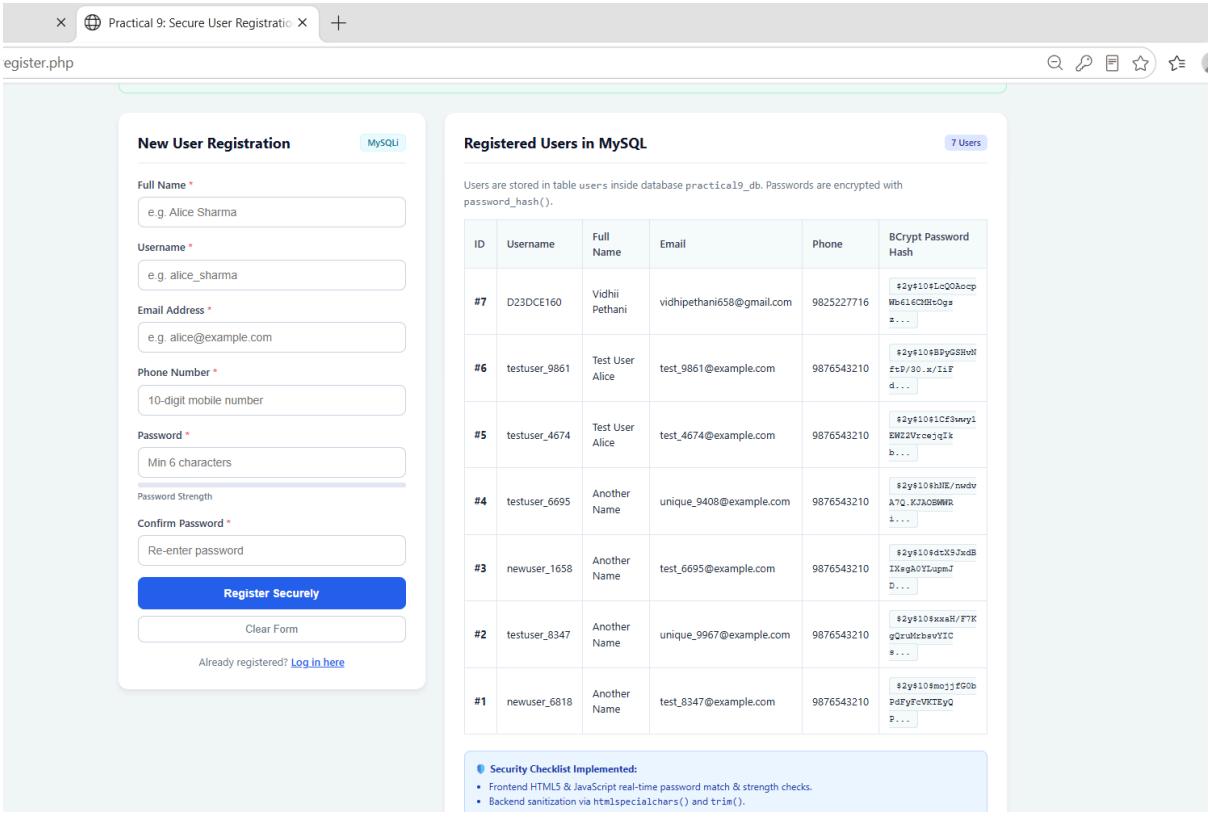

1. Is password_hash() used before storing passwords?
Yes, PHP's password_hash() function is used to hash passwords before storing them in the database, improving password security.

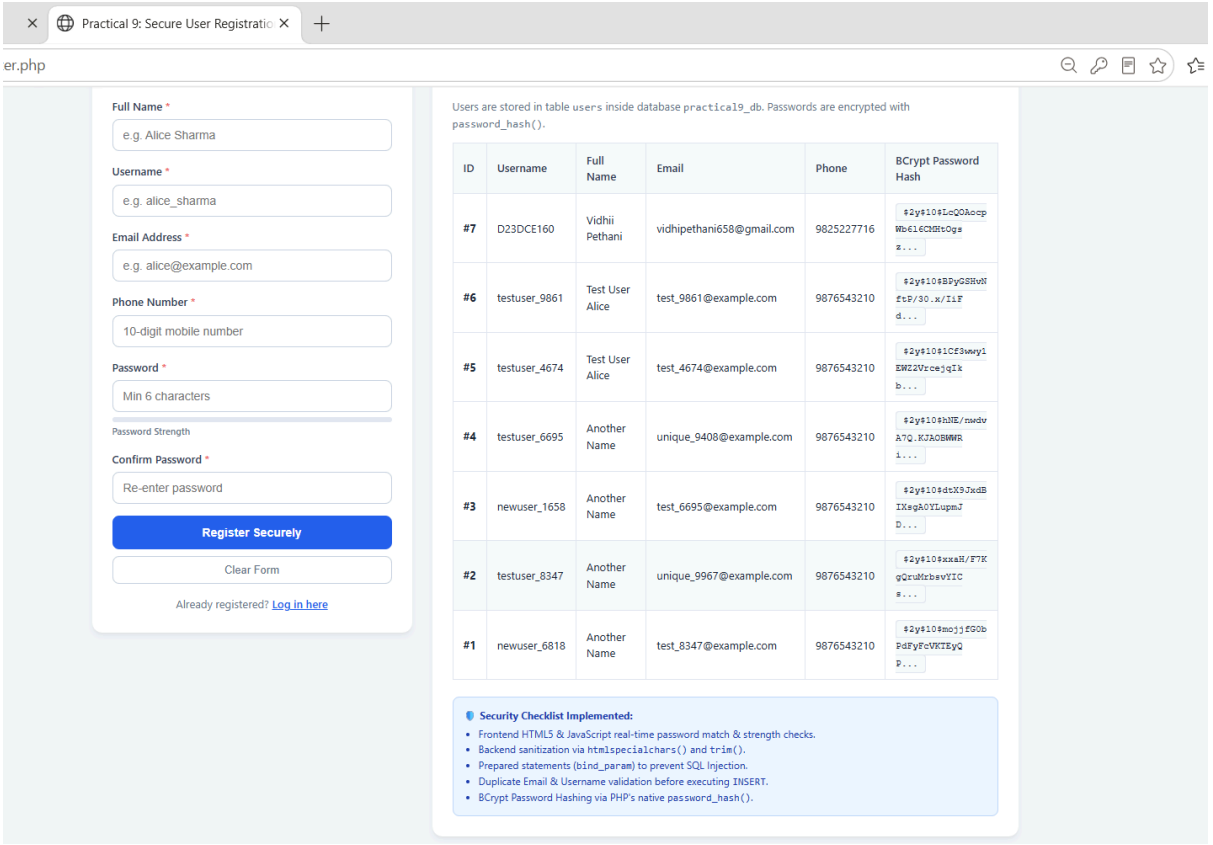

2. Is duplicate email/username checked?
Yes, the system checks whether an email or username already exists before registering a new user to prevent duplicate accounts.

3. Are frontend and backend validations consistent?
Yes, frontend validation using HTML and JavaScript provides quick feedback, while backend validation using PHP ensures data is validated securely on the server.

Output:

GitHub Repository Link :

25DCE091

https://github.com/vidhipatel2008/25DCE091-web/tree/main/practical%209

Challenges Faced: I found it difficult to check duplicate emails and usernames and store user details correctly in the database. Understanding password hashing and maintaining consistent validation on both the frontend and backend also required practice.

Learning Outcomes: I learned how to register users securely by inserting their details into MySQL using PHP and MySQLi. I also understood password hashing using `password_hash()`, duplicate email/username checking, and frontend and backend validation.

Faculty Remarks:

Practical-10

Practical 10: Secure Login/Logout with Sessions, Role-Based Access, Timeout, and Remember-Me Token

Problem Definition Develop secure login and logout functionality using PHP sessions. Verify password using password_verify(), regenerate session ID after login, restrict dashboard access, implement role-based redirection, session timeout, and optional secure remember-me token.

Key Questions / Analysis / Interpretation

1. Are sessions started and destroyed securely?

Yes, session_start() starts a session, session_regenerate_id(true) prevents session fixation, and session_destroy() destroys the session during logout.

2. Is password_verify() used correctly?

Yes, password_verify() checks the entered password against the hashed password stored in the database.

3. Is unauthorized dashboard access blocked?

Yes, session authentication and role checks prevent unauthorized users from accessing admin or student dashboards.

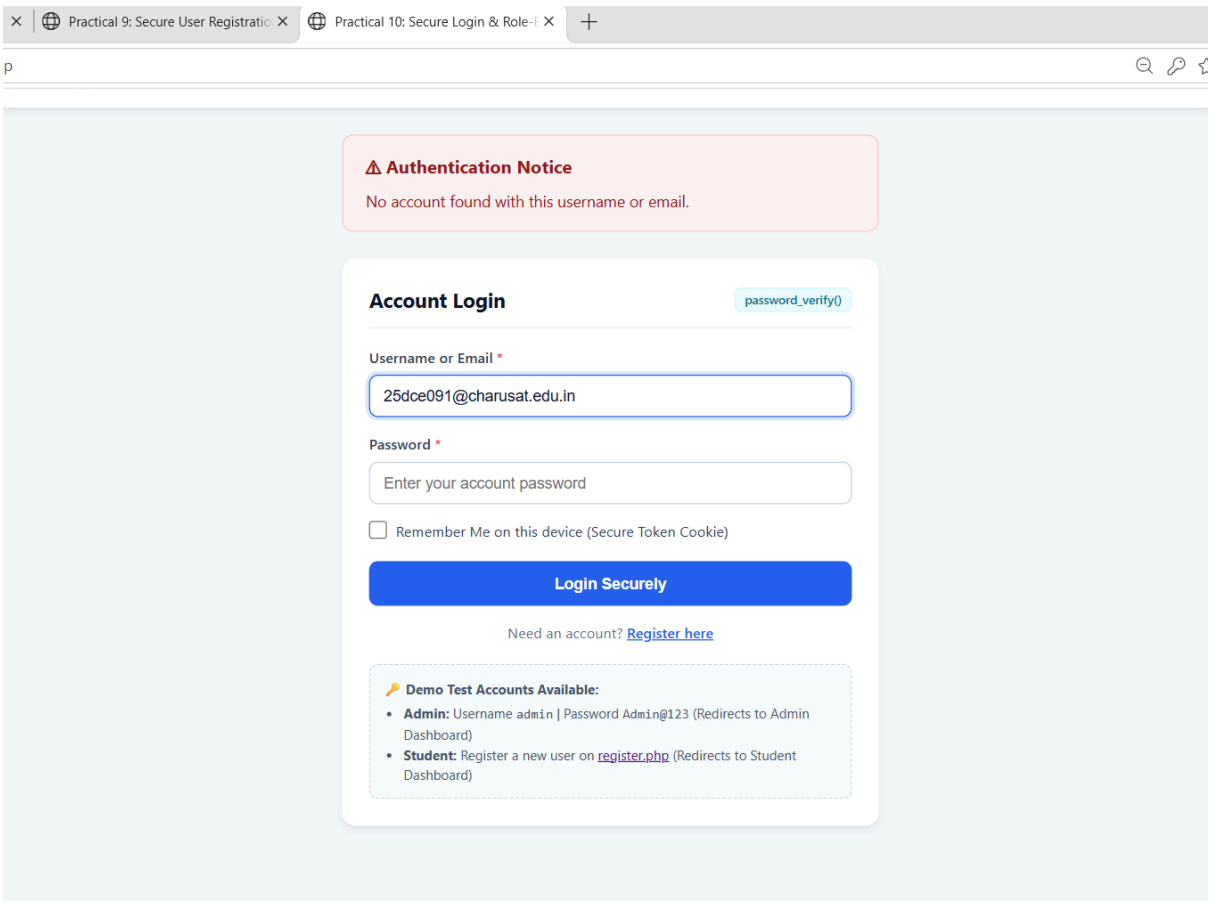

4. Is session timeout implemented?

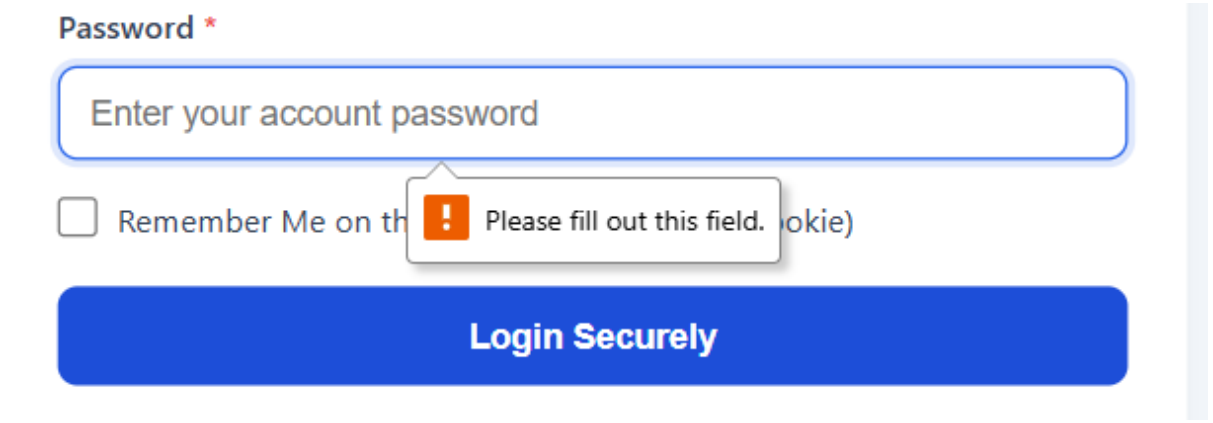

Yes, the session expires after 15 minutes of inactivity, and the user is redirected to the login page.

5. Are admin and student users redirected to appropriate dashboards?

Yes, admin users are redirected to admin.php, while student users are redirected to student.php after successful login.

Output:

GitHub Repository Link :

https://github.com/vidhipatel2008/25DCE091-web/tree/main/practical10

Challenges Faced: I found it difficult to understand session management, password verification, and dashboard access control. Implementing session timeouts and redirecting users to the correct dashboards also required practice.

Learning Outcomes: I learned how to manage PHP sessions, verify passwords using `password_verify()`, and protect dashboards from unauthorized access. I also understood session timeouts and role-based redirection for admin and student users.

Faculty Remarks:
